REDUCTION OF Si AND Ge CHLORIDES AND THE
FORMATION OF CRYSTALLINE FILMS, tr. by
A. Werner. [1960] 13p. 3 refs.
Order from LC or SLA mi\$2.40, ph\$3.30 61-10327

Trans. of Zhurnal Neorganicheskoy Khimii (USSR)
1957, v. 2, no. 2, p. 233-237.

Calculation of the equilibrium constants of the reduction reaction of silicon and germanium chlorides with hydrogen shows that with increasing temperature the reaction equilibrium is considerably shifted toward increasing yield of the silicon or germanium. For obtaining germanium and silicon in quantities requisite for the formation of sufficiently thick and dense films the original concentration of hydrogen must considerably exceed the concentration which corresponds to stoichiometry. The thickness of films and their structure is dependent on the duration of the crystallization process, the temperature, concentration of vapors of silicon or germanium and the presence of impurities in hydrogen.
